Lido Grocery Store

Assignment 4-5 | JavaScript implementation report
Author: Temirlan | Verified: 23 October 2026

Repository: github.com/Temirlan222/WEB

Current submission: latest main branch. Published milestone tags below retain their original snapshots.

Milestones: assignment-4 - data and logic; assignment-5 - complete interactions and evidence.

Contribution and purpose

This contribution continues the existing Lido website. It covers Temirlan's Home and Products pages and a shared cart link with a quantity count on all six pages. Visitors can find a product, calculate an example basket and check a product enquiry before contacting the shop.

Implemented visitor journeys

Feature	Completed behaviour
Product catalogue	Eight existing project products are rendered from one array. Search and category filtering work together. The visitor sees a matching count, an empty state, a reset option and an Add to cart button. Original store photographs remain available below the catalogue.
Shared shopping cart	Add products, increase or decrease quantity, remove an item and clear the basket. Every change recalculates line subtotals, total quantity and total price. The count survives navigation through localStorage. Empty checkout is disabled.
Product enquiry	The existing form checks name, email, phone, product, quantity, category, contact method, acknowledgement and optional date/comment. Phone contact requires a valid phone number. Errors appear beside fields; the first invalid field receives focus. A valid form produces a local summary and focuses its confirmation.

Implementation approach

The site uses plain JavaScript and the existing Bootstrap styles. Shared data and reusable functions are in store.js; main.js manages the cart and shared navigation. products.js builds the catalogue; request.js handles the enquiry form. Scripts use defer, strict mode, const and let.

All six source HTML pages match the midterm snapshot except for script links. All four stylesheets are unchanged. New controls, cards, feedback and cart items are created through DOM methods. Existing classes control hidden, active, selected, error and success states.

Behaviour and verification

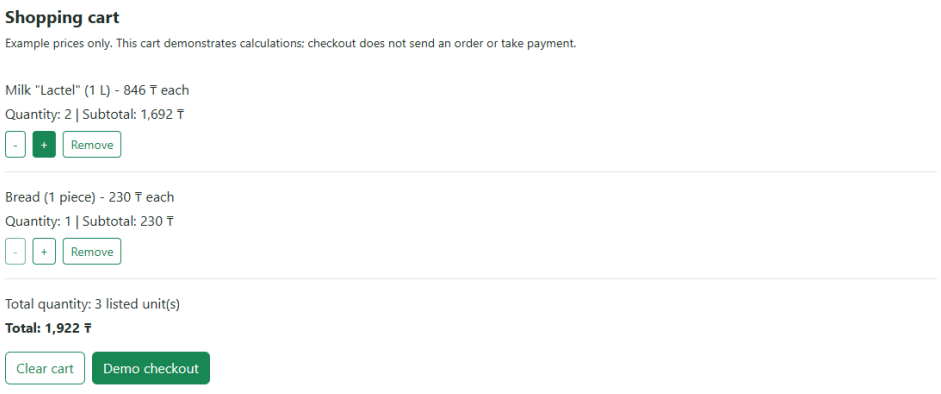

Demonstration boundaries

Prices and units come from the recorded project price table. They are examples, not live stock or a current price guarantee. Product photographs are illustrative and retain source credits. Demo checkout shows an item summary, total and a temporary DEMO reference, then clears the cart. No request, order or payment is sent to a server.

Only product identifiers and quantities are stored. Contact details are not saved or placed in the URL. Visitor text is displayed with textContent. Editing a form clears its outdated confirmation; resetting it clears feedback and the character counter without affecting the cart.

Recorded checks

Check	Observed result
Calculations	Milk (846 ₸) + bread (230 ₸) = 1,076 ₸. Increasing milk to two units gives 1,922 ₸. Decrease, remove, clear and empty checkout were also exercised.
Input and state	Combined filters, no results, reset, invalid/valid form paths, phone preference, safe literal text, corrupt storage and repeat keyboard changes passed. Successful form confirmation stays visible/focused at 375 px with eight cart items; Reset preserves the cart.
Responsive interface	All six pages were checked at 375, 768 and 1366 px: no horizontal overflow, missing images or duplicate IDs. Browser checks found no console or script errors.
Source and markup	Source-freeze and JavaScript syntax checks passed. Nu HTML validation reported no messages for all six source pages and their generated DOM snapshots. Local links and fragment targets were checked.

Recorded cart example: two units of milk and one loaf of bread.

Repository materials

The submission folder includes this report, the Functionality Plan, an exact-line JavaScript checklist and recorded screenshots/check results. The midterm tag is preserved. This report describes Temirlan's individual scope; other contributors' page features are outside this contribution.
