

Lido Grocery Store Midterm Report

Introduction to Web Technologies

Author: Temirlan | Contribution: Home and Products

Project and scope

Lido Grocery Store is a six-page website about a real grocery shop at Uly Dala Avenue, 31, in Astana. The project continues the same HTML and Bootstrap website developed in Assignments 1-3. My contribution covers the Home page (index.html) and the Products page (products.html). This report describes those two pages and their role in the website.

Home page

The Home page introduces the shop, its location and its product range. It includes a photograph of the entrance, information about everyday groceries and household goods, the listed 24-hour opening schedule and an explanation of the website. Navigation connects visitors to Products, Prices, Order and delivery, Contacts and About this site. The footer provides the address, telephone link and map link.

Products page

The Products page presents photographs and descriptions of food, accessories and household cleaning products. The content includes a category list, a definition list explaining the departments, information about changing availability and a quotation recorded during the team visit. A product request form contains labelled name, email, telephone, product, quantity and date fields, a category selector, contact preferences, a consent checkbox and an additional-information field. A visible note explains that the local form does not send a request to the shop.

Layout and structure

The pages use semantic HTML for the header, navigation, main content, sections, articles, figures and footer. Bootstrap is loaded through a CDN and supplies containers, responsive rows and columns, cards, typography, buttons, spacing and alignment utilities. Columns stack on phones and use more horizontal space on wider screens. A small external correction stylesheet preserves the green and cream colour palette. Input ids connect labels to fields and provide useful reference points for later interaction work.

Three visitor journeys

- 1. Plan a visit.** Start on Home, read the shop description and opening hours, then find the address and map link in the footer.
- 2. Explore the range.** Start on Home, open Products through the navigation, browse the photographs and category descriptions, then follow the Prices link to compare listed items.
- 3. Prepare a product enquiry.** Open Products, find the relevant department and request fields, read the submission note, then find the shop telephone number for an enquiry.

Repository

The project remains in the original shared repository:
