

Lido Grocery Store

Bootstrap implementation summary | Author: Temirlan | Scope: Home and Products

The existing Home and Products pages were adapted to Bootstrap 5.3.8. The store content, photographs, navigation links and main page sections were preserved. Bootstrap now controls the layout, spacing, navigation, buttons and responsive behaviour.

Repository and submitted work

GitHub: github.com/Temirlan222/WEB

Code version: 321e680 - Home and Products implementation

Supporting materials: Grocery / Temirlan_Assik3

What changed

Layout. Responsive containers and columns now organise the store introduction, opening hours, product gallery, descriptions, request form and footer. The form includes a nested grid.

Navigation. The existing menu collapses on narrow screens and opens with the standard Bootstrap toggle button. No custom JavaScript was added.

Content and controls. Bootstrap typography, responsive alignment, spacing, borders, shadows and button styles replace hand-written presentation rules. Existing product articles use the Card component.

Custom CSS. The personal stylesheet was reduced to 25 lines, including comments and blank lines. It keeps the store colours; Bootstrap supplies the layout.

Request form. The form is a local demonstration. Submission is disabled with an explanation because no request-processing service exists. The Reset control remains functional.

Validation

Both pages were checked at 375, 768 and 1366 CSS pixels. No horizontal overflow was found; images loaded and navigation opened and closed correctly. Local Nu HTML Checker 26.9.27 reported **zero errors and zero warnings** for both HTML files.

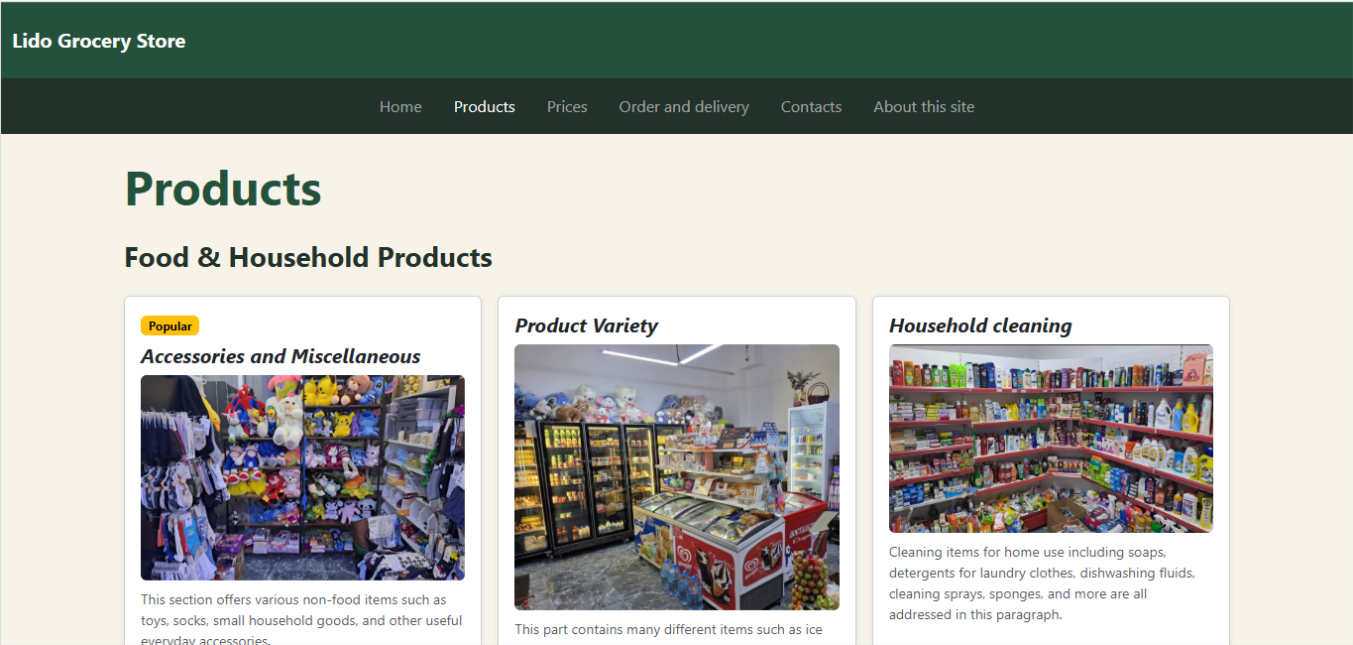

The project runs from local HTML files. An internet connection is needed to load Bootstrap from the CDN. The repository includes the CSS replacement list, README, four full-size screenshots and validation results.

Desktop and tablet

Products page | Screenshots show the top viewport; full-page evidence is included in the repository.

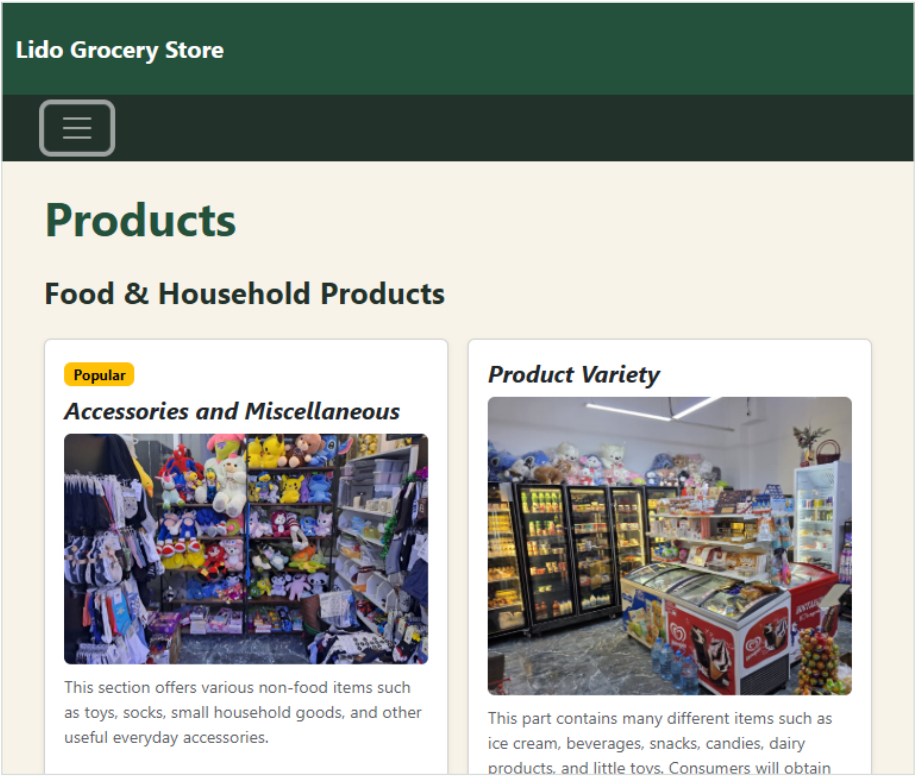

Desktop - 1366 CSS pixels

Three product cards share one row. The navigation is fully expanded.

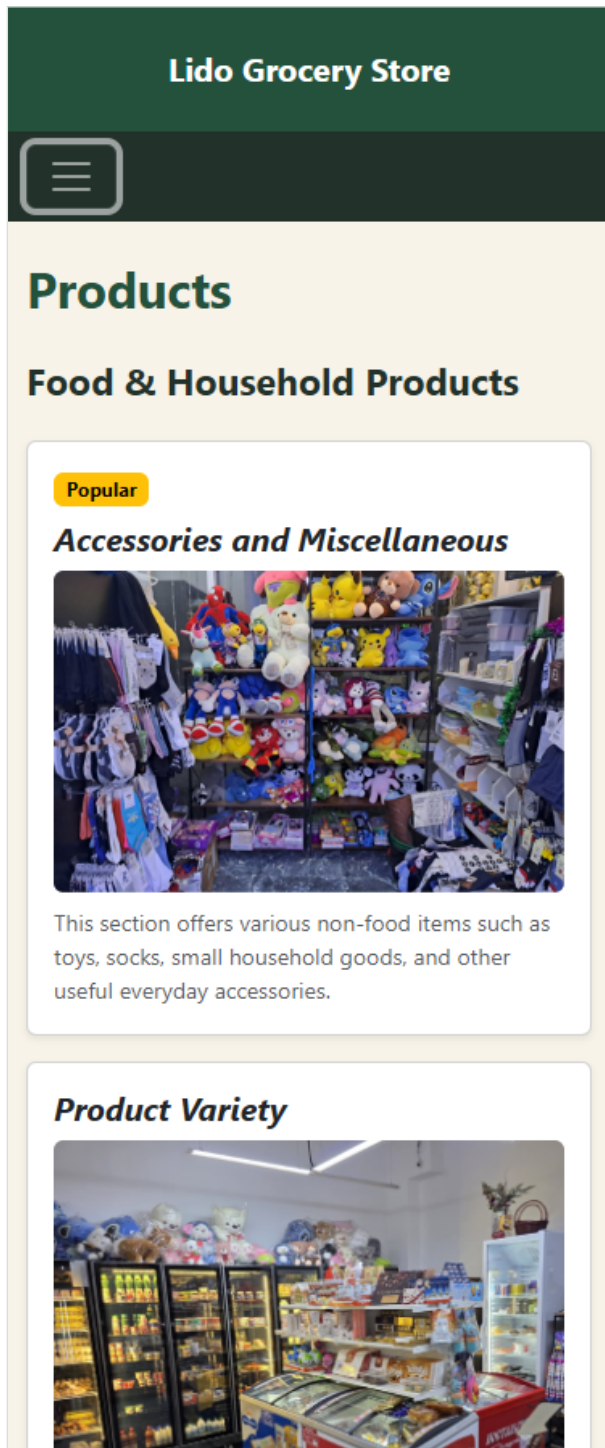

Tablet - 768 CSS pixels

The gallery uses two columns. The navigation is accessed through the toggle button.

Phone and navigation

Products page | 375 CSS pixels | A single-column layout keeps content within the viewport.

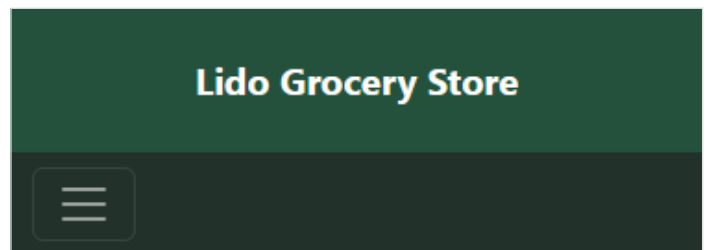

Phone layout

Product cards occupy the available width. Text and images stay inside the page, without horizontal scrolling.

Collapsed navigation

The toggle button is visible and the menu links are initially hidden. Opening and closing were tested on both pages.

The four original evidence files remain available in the repository: phone, tablet, desktop and the collapsed phone menu.
